

The present GoDaddy domain configuration is based on the configuration of a customer.

This procedure shows you how to configure several domains to share the same directory path than the master domain.

The steps described below are:

- Login to the "Hosting Management" -> "My Hosting Account"
- Manage the Hosting: Select "My Products" menu, option "Hosting" and in "Control Panel" click on the link "Manage Account"
- Go in the "Domain Management".
 - Open the "Setting" panel;
 - Click on icon "Domain Management" to display the list of domains that are currently attached to your account.
- Click on button "Add Domain" (top right)
- Enter your "**domain name**" and specify its "**folder**".

For Joomla Multisites, put here the **same folder than** the one used by your **master domain**.

Domain Bulk

Adding a domain to this hosting account lets visitors access your content through a new URL. Premium plans can point an added domain to any new or existing subdirectory or nested subdirectory. If you point this domain to the root ("/"), leave the default Folder setting. Economy plans can point to the root.
