How can we custom define custom tables to use with our extentions?

Your question is not clear.

When you create an extension, you have to create a manifest file (xml) where you describe all the files that must be installed and also the MySQL tables that must be created.

So if you are have a package of your extension, you can install it joomla.
As this is a specific extension it will not be recognized by the JMS tool.

In this case, you have to go in the slave site and re-isntall the extension to let it creates the MySQL table that are defined in its manifest (xml).

So just install the extension in the slave site.

If you want to create specific sharing rule, this is not directly possible.

The only solution is that I create a specific plugin for you that would let you declare the specific rule.
Such kind of plugin can be create in 1 hour.
http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1

Becarefull when defining a rule that you must ensure to keep a data model consistency.
This is the reason why we do not provide sharing for all the extensions.
So you must be an expert when doing such specific rule.
