Problems copying Modules to child site..

Posted by scottsimsa - 2011/04/28 15:31

I'm using a Module called BJ Image Slider 2 and I have it installed on the parent site and it works just fine.. The I try to Propagate to a child site and it works except I go to the module and it is missing the parameters and it is not showing on the site..

Any idea of what I can do to get the parameters available would be much appreciated..

I've also tried a different slider module and it has the same problem..

I'm using Joomla v1.5 and Multi sites v1.2.49

I don't know this BJ Image Slider.
Would you please send me this extension in the attachement of an email for review.
The email address is present in the "contact us".
