

## Jms Multisite for joomla version 1.3.74 - All Editions

Fix the definition of new extension in an existing website with the JMS Open/Save definition when the slave site had used the Joomla / Extension / Discover menu.

In Joomla 3.x, when an extension is discovered, joomla adds its definition into the DB with a specific state that JMS didn't took into account.

This fix consists in comparing the extension between the parent (generally the master) and the slave site to deploy by excluding all the "discovered" and not installed yet extensions.

### Full Editions (only)

Add the possibility to create views (Partial Sharing) based on on "userdefs" field.

In this case, the tag is {userdefs:<field name>}.

Also added the {user\_id} as keyword in <tablewhere> to allow customization record based on the user that create the website.

This can be helpfull when building affiliate websites.

### Bundled with Patches definition 1.3.67

- Add JMS Tools (install) definitions for :
  - Droptables
