Extension not found in master site message

Posted by mariusd - 2010/07/04 09:38

I have a slave site replicated from the master site. I installed new component (Advanced Module Manager) and some modules (Easyblog), but when I try to install same in the slave site, I get the message that they are not found in the master site. But as indicated they are indeed installed in the master site.
Is there anything I can do to make Multisites accept the installation of extensions in the slave site, or do I have to replicate from scratch?

I have found discussion related to this over here:
http://www.jms2win.com/forum?func=view&id=582&catid=3
and here:
http://www.joomla-multisites.com/forum/24-joomla-multi-sites-configuration/2170-cannot-install-component-in-slave-site

It seems the issues may be extension specific.

If these extension have a special installation like "nonumber" company, they require that we define in the JMS Tools their definition.
If they are not yet defined in our JMS Tools then send us these extension in attachement of a email to allow us review them and perhaps add their definition in the JMS Tools.
