Compatibility with Projectfork and Repository

Posted by homeaccount - 2010/08/16 20:04

Hi,

I am interested in this product. However, before I purchase this, could you please let me know if JMS is compatible with Projectfork (Project Management System)and Repository (Document Management System).
Thanks

YES you can -install ProjectFork in JMS Multisites master and also in the slave site.
It is not yet present in our current list of extension.

We have recently added this extension in the list of extension and it will be available in next patch definition 1.2.42

So does this mean I have to wait for the 1.2.42 patch before I can use JMS-Multisite with Projectfork ? If yes, could you please email me the link where this patch will be released so that I can keep an eye for it and get it as soon as it is released. I couldn't find the link on your website where 1.2.41 or any previous patches were released or announced.
Thanks

No.
This mean that you have to login in the slave site and re-install ProjectFork in the slave.
The possibilty to install it from the JMS Tools will be possible when the definition will be added in the patches 1.2.42.

You have 3 methods to have an extension present in a slave.
1) Re-install the extension in the slave (the solution proopose).
2) Use JMS Tools when the extension is defined in the tool (not yet - will be included in 1.2.42)

3) Replicate a website that already contain the extension.
