About compatibility with JoomDOC

Posted by VDmitry - 2010/08/30 21:22

Dear Edwin!

I have installed last version of JMS, Joomla 1.5 and JoomDOC. Problem is common docman.config.php file for all slave site. I have seen your patch for it and make manualy subsite config files, but result is bad. Could you make any advice how resolve it problem?

Br, Dmitry.

You make refence to a patch that is provided for DocMan and not for JoomDoc that are 2 different extensions.

If you are using DocMan, you have the possibiilty to change the path of the DocMan directory.
So check the DocMan configuration.

Perhaps JoomDoc has also a configuration to specify the dmdocument directory like this is the case with DocMan

Hello Edwin!

JoomDOC is based on DocMan component with similar (maybe full same; config file is same) files scructure (http://www.artio.net/downloads/joomla-related/joomdoc/joomdoc-2-0-2/details). Could you convert DOCman to JoomDoc patch or make recomendation for do it and applay?

Br, Dmitry.

If JoomDOC has the possibility to configure the dmdocument directory, why don't you use it ?

The patch was present when this feature was not present in DocMan.

_____

Dear Erwin!

I can configure dmdocument folder in each slavesite, but it path is saved in one config file for all sites. I need possibility to have config file for each subsite separatly, for example, Site_Root/administrator/components/com_joomdoc/docman.config.site_ID.php, or save it conig file in Site_Root/multisites/Site_ID any (sub)directory. I would like to save upload files in Site_Root/multisites/Site_ID/joomdocs(or dmdocument) directory.
Could you write any recomendation about prepare JoomDOC patch based on DOCMan patch and/or pacth activation scenario?

Br, Dmitry.

_____

Today, all I can see is that JoomDoc can not be installed with success and I don't want to create something on an extension that is not stable.

If you want to benefit of this functinaliity, I suggest that you use DocMan

_____

Dear Edwin!

Thank you for your replay. I will try to use other component.

Br, Dmitry.

_____

Dear Edwin!

I have installed latest versions of DocMan1.5.8/JMS1.2.37 and have applayed path, but I have some problem with upload/download documents. After install DM I have changed conig (docman path and write policy). Problems are next:
1) If I upload document from FrontEnd, I can see it in www_root/dmdocuments folder only (bad). After approve document I can download it in FE, although I see in DM's backend that file is absent.
2) If I upload document from BackEnd, I can see it in www_root/multisites/slavesite/dmdocuments folder (good).After approve document I can not download it in FE, although I see in DM's backend that file there is.

Could you maka any rekomendation for resolve its problems?

Br, Dmitry.

Cross-check that you have correctly configured your server to assign the domain or subdomain to the appropriate slave site deployed directory.

Dear Edwin!

I have changed VirtualHost from root_site/multisites/slave_site to root_site.
After it problem with load documents was resolved, but I have got new problem with Phoca Gallery 2.6.2. I can upload and make thumbinal, but I see result in folder only (in image folder of slave_site there ara uploaded file and thumb). In BE/FE I have no image (empty).
Could you make any recomendation for resolve it problem?

Br, Dmitry.

Again, Cross check the consistency between the HTTP Admin tool and the configuration of the domain or subdomain.
You must have exactly the same deploy directory than your domain or subdomain document root path that you have defined in your HTTP administration tool (cPanel, Plesk, ...)

_____

Dear Edwin!

Problem was in SlaveSite config, because multisite folder was set as Ignore instaed of link.

Br, Dmitry.
