Mobile Component compatability

Posted by mismarketing - 2010/10/01 00:17

Hey Edwin.

when i edit the info for the mobile component (here) it changes on all my sites. I need to be able to edit this for each site. So i can have a mobile version of each site.

Does this just need to be patched to work with jms?

Thanks
Kyle

I have checked and this is exact.

I will have a look to create a patch to have a specific configuration for each slave site.

thanks edwin.

one question about this. you edited the file:

/administrator/components/com_joomlamobile/config.php

on line 95 it has the "desktop" url. so if i enable the mobile site, and enable the link to the destop URL i should be able to browse the site from a mobile device and see the link to the desktop version if i want to use that.

ok. well, the component doesnt give you the option to edit the desktop URL. so when i push this to my slave sites this link is always to my master domain. is there a way to make the JMS write that line to the slave ID url?

Thanks

Re: Mobile Component compatability
Posted by edwin2win - 2010/10/11 09:49

Sorry but I don't find this "desktop" variable in the config.php
Perhaps this is resulting of a computation somewhere that I don't know.
I did the patch for the Mobile Joomla 0.9.2

When I search for the "desktop_url" variable, the only place where I find it is in the installation procedure.

So if you want that this variable become specific for each slave site, I should modify the patch to overwirte the value or you modify the value manually in the appropriate config.php file.

I only see the usage of "desktop_url" in the module mj_markupchooser.
I don't understand why they use a variable as its value seems always be

$MobileJoomla_Settings = JURI::root ();

_____

honestly edwin,

im dont get this at all. im a css/html design guy. i can make anything look how you want it...the php is outside my scope.

that said i know enough to look at it, and say this looks like what im looking for. So i was trying to give you a heads up on the line to see if you got it.

All i really know is i need the desktop version to be domain specific. i have a thread on his forum also about this.

_____

MisMarketing,

I'm hoping you can help me some, since you have been playing with this Joomla Extension already. I have updated to the latest version of JMS Multisite, and installed the latest patches as of 10/25. I have installed the JoomlaMobile to my master site and attempted to "push" the installation through Multisites to my slave sites, and I have attempted performing the install through the Slave Sites; however, the only way I can get the TWURFL tool to install to the slave sites is a manual push of that plugin from the master site. It does not get installed when pushing the component, nor when performing a manual install on a slave site, which leads me to the real problem. I found the TWURFL plugin and have been able to push it, and some other plugins for this tool to the slave site; however there appear to be several modules related to Mobile Joomla that my Master site has installed, but MultiSites does not display them for pushing, and the manual install does not install them either. Have you figured out a solution for this?

Thanks in advance,
Sam

I'm trying to get this figured out myself, is there a clear fix or work-around?

OK, couple problems...

1. So I found many of the modules/plugins that I thought were being missed; however, I can not find the mod_mj_markupchooser module on the slave sites, and I can't find the option through MultiSite to install it...

2. Every time I update the website links in the component settings they change on every single page!

---

2) In general, most of the modules and plugin does not create specific MySQL table but just read existing table.
So you can go in the JMS Multisites tool menu and try "define" the module in the slave.

2) This is not clear.
What do you mean by update weblinks in the component setting.
Do you mean that this affect other website ?
Which extension name ?
Is this in "Mobile Joomla" ?

Which version of JMS Multisites are you using and which patch definition ?
Did you install the patches for "Mobile Joomla" ?

So you can go in the JMS Multisites tool menu and try "define" the module in the slave.

I understand this, as this is how I found the menu modules. But as I was trying to indicate, I can not find/define a module in the slave sites based on the mod_mj_markupchooser module that is listed in my Host site... And even though it is listed in my host site, I can't install it, like I can most every other module, to my slave sites.

Which extension name ?
Is this in "Mobile Joomla" ?

Which version of JMS Multisites are you using and which patch definition ?
Did you install the patches for "Mobile Joomla" ?

This is very simple....
Login to administration, hover mouse over components, click on Mobile Joomla, and when the Mobile Joomla Component configuration comes up (as I indicated in my previous post) there are fields here for setting the desktop/mobile version links. If I change any of these links to the address for that specific Host or slave site, it will update this setting for every other slave site, or even the host site.

As for version information I can't get to that right now, but I can say that I downloaded the latest version and patches as of 11/7/2010 around 9PM, and I still have this problem... and Yes I noticed the Mobile Joomla specific patches after the installation last night... which required me to reinstall Mobile Joomla on my Host Site and slave sites to get it working again, and still yet updating this link information affects all sites (host & slaves).

Sorry but I don't see the parameter "desktop/mobile version link".

Would you please provide a screenshot and surround this parameter.

When I go in "kuner mobile joomla", I have several tabs in the "settings" menu and I don't find your parameter in the "Global Settings" tabs.

We don't have the same version as we don't have the desktop parameter that you show here.
Would you please send us in the attachement of an email the version that you are using.
The version that we are using is 0.9.2.

Hi,

I would like to get the mobilejoomla patch updated also. It doesn't currently seem to work.

It works on the master site, but not on any of the child sites.

You can get the latest version from here:

http://www.mobilejoomla.com/

I have also attached it.

Re:Mobile Component compatability

Posted by edwin2win - 2011/01/30 11:32

If they changed DB layout or other thing that mean this is not an update but an upgrade.
In this case, to apply all the modification, you need to re-install the extension in the slave to let it do its job concerning the upgrade in the DB

==========

Re:Mobile Component compatability

Posted by markmongie - 2011/01/31 06:15

Have you tested it to see if it still works as intended?

If I install in the master will it get created in any new children?

==========

Re:Mobile Component compatability
Posted by edwin2win - 2011/02/01 12:23

I don't have mobile phone.
So I am not able to test if it works on a mobile.
All I can tell you is that I don't have any error message and that I can access the back-end.

If you know a simulator that would work on a localhost PC, perhaps you could describe us a procedure to test it.

There is this you can use on a windows PC - http://labs.blackbaud.com/NetCommunity/article?artid=662

It is an iphone simulator

==========

Re:Mobile Component compatability
Posted by markmongie - 2011/02/07 05:11

I believe there is a problem because the configuration is stored in a file, and not in the database.

So all the child sites end up with the same configuration - including the domain, which is obviously not going to work across the child sites.

==========

Re:Mobile Component compatability
Posted by markmongie - 2011/02/07 08:59

I am also getting an error that the component isn't installed on the master site, when I am very sure that it is.

Re:Mobile Component compatability
Posted by rwickham - 2011/12/21 22:12

I am having the same issue with Mobile Joomla of the settings shared among child sites. When I change a setting in one child site it changes in all child sites. I really like Mobile Joomla and would like

to use it on all of my child sites, but at this point I cannot. I read here about a patch that was available for a previous version. There is no mention of it on the Mobile Joomla site. I am using Joomla V1.7.1, Multisites V1.2.70, and Mobile Joomla V1.0-RC5. Has anyone had success with this?
