PLEASE HELP!

Posted by web2sign - 2010/12/18 12:05

---

i have a big problem... I really need the advance module installed to my slave site but its not installing... it always notifying that I have to install the extension first before on the slave... but I already installed the advance module on master site... please help.... i really need it...
i have a deadline project on monday and without advance module I can no longer that my task.... please

here's the link of the extension that I want to install on my slave sites
http://www.nonumber.nl/extensions/advancedmodulemanager

please i really need help T__T

NoNumber company use a specific "experimental" installer that use another component extension to install the target extension. In the nonumber distribution package, the installation does not contain the name of the one finally installed. This is the reason why JMS Multisites report you that it is not installed in the master.

See a very old post in the forum that explain such problem with nonumber
http://www.jms2win.com/forum?func=view&id=582&catid=3

With the benefit of the JMS Multisites Tool menu, you can install the extension without using the author installation.
The Advance Module Manager is defined in the JMS Tool menu.
So if you go in the JMS Tool menu, you can select the slave site where you want to install the "Advance Module" component and its plugin "System - Advanced Module Manager"
