I want to roll back to patches patches 1.2.51

Posted by alan1987 - 2011/02/28 19:07

I want to roll back to old patches. In new patches i am finding difficulty in sharing RSEvents between master and slave. In the Earlier version it was so easy to share between master and client.

Please reply us back as soon as possible.

Rollback to an older patches definition is not possible except if you re-install an old JMS Multisites version 1.2.45.

We verified the definition of the RSEvents and there is no difference between patch 1.2.51 and the latest one 1.2.54.

Would you please give a detailled description of the problem that you encounter as there is no difference in RSEvents.

In old patch we were getting oly "Share from master" option, at that time everything worked fine. Now you guys added another option as "Install from master", Now when i use share from master, its giving some error.

I have attached screenshot of error we are facing.

FYI We are using MultiSites in our 5th project. Earlier we never faced any problem like this. Please advise as soon as possible

Install and share are 2 different things.

You mentioned that you had an error but you didn't give it.

If you don't have the "share" option available then you have to check if you are using MySQL 5.x or still using MySQL 4.x.

I don't see any changed in the RSEvents and its definition is exactly the same.
So perhaps you have another RSEvents version that has another definition that is not defined for the JMS Tools and template.

The latest RSEvents version that we reviewed is the 1.0.0. Rev 19.

So provided detailled description and error messages that allow identifying what is different in your current project.

We were able to figure out all the errors we were facing. There was some database grant permission issue. We figured out all the things.

Thanks for the support

Glad to see that you finally found the origin of the problem and this is not a problem in JMS Multisites patches definitions.
