Webee Comments

Posted by blissco - 2011/09/21 15:02

Greetings,

I have a problem with the component "Webee Comments", and I hope you can help me solve it.

I have multiple sites set up; each site uses a different template. When I click on the "Comment" link provided by the "Webee" component on a slave site, the template gets all messed up.

I traced the problem to this fact:
When you click on the "Comment" button, the Webee component load a page using an AJAX command. The page loaded is "index2.php". This index2.php loads the "default" CSS stylesheet from the Master site, overruling the slave own CSS stylesheet.

The URL provided to the AJAX function contains the correct domain, and I do not understand why the page loads the wrong stylesheet. Does JMS parse the requests to index2.php or just the request to index.php?

I hope you can help me fix this problem.

Joomla version: 1.5
JMS version: 1.2.64
Webee Version: 2.1

Thank you.

Update:

I kept researching for a possible solution, and I found that the use of "index2.php" in Joomla 1.5 is deprecated. The AJAX function calls for a URL like this one:
http://www.slave-domain.com/index2.php?option=com_webeecomment

I read that it should be like this one instead:
http://www.slave-domain.com/index.php?option=com_webeecomment&tmpl=component

I tried to replace the deprecated link with the correct one, but the result is still the same: the page loads the CSS stylesheet from the Master domain, and not for the slave domain. The HTML of the loaded page contains this:

link rel="stylesheet" href="/templates/master_template/css/template.css" type="text/css"

instead of

link rel="stylesheet" href="/templates/slave_template/css/template.css" type="text/css"

thank you.

_____

Update #2:

I found the solution of my problem. I had an error in the template file "component.php", which was loading the wrong template file.

Thank you.
