

Lost language tag with some extension slave site

Posted by illanosb - 2013/07/30 23:20

I have problem with some extension on slave sites, I have an installation joomla 2.5.9 spanish language with multisites "Version 1.3.10 - FULL Patches definition Version 1.3.07", but some extensions have display problem in the backend.

For example: "mod_lofarticlesslideshow" doesn't show params configuration in the slave, but in the father all is ok.

Module mod_rseventspro_upcoming doesn't show language tags

Module mod_sobipro_entries doesn't show language tags

I attach some screenshots.

Please some help, I need this extensions work fine.

Here you can get the extension mod_lofarticlesslideshow

<http://www.landofcoder.com/download/free-extensions/viewcategory/8-lof-articlesslideshow-module.html>

When I compared the HTML source from master V/S Slave in the backend some script were missing

modules/mod_lofarticlesslideshow/libs/elements/media/form.css

modules/mod_lofarticlesslideshow/libs/elements/media/form.js

How can I fix this? Some clues?

Best regards

There are something with the path, if I put full path work better in the slave but both master and slave lost the scripts...

relative path

full path

I found the problem here:

mod_lofarticlesslideshow/libs/elements/lofspacer.php

Sample code:

```
$uri = str_replace(DS,"/",str_replace( JPATH_SITE, JURI::base (), dirname(__FILE__) ));
```

The dirname is diferent in the slave, because we use simbolic link to the master.

May be the same issue happens with other extensions.

Can we have some patch for this situation?.

I suggest that you report the issue to the author of the extension.

Effectivelley the dirname(__FILE__) always return the physical location on the disk and it can be different of the JPATH_SITE.

A possible solution could consists in removing the dirname(__FILE__) and provide path manually based on JPATH_SITE like JPATH_SITE.'/modules/mod_lofarticlesslideshow/libs/elements/lofspacer.php'
