Problem with Geo Location

Posted by fgmedia - 2013/05/17 09:26

Hello I bought a version of JMS Multi-Sites 1.3 with geolocation (medium version), but it does not work. In the setting of the data according to prescribed instructions, screenshots attached to the subject. But when you go to the site opens the main site, not the one for which you set the geo location. The logs city determined, but redirect to the correct subdomain not. Show you how to properly set up geo location?

I installed the component to the new site http://domen.ru/ and geo location is not working again.
I go to the main site http://domen.ru/, there is no forwarding to
the regional http://kaliningrad.domen.ru.
If I go to a regional http://kaliningrad.domen.ru, then logs the following error (in the screenshot). What to do?
