iPhone site failure

Posted by indigoallan - 2013/08/04 10:25

Hi

I have a fresh Joomla slave site fully installed and set up. When I use a desktop PC I can access my slave site via Firefox and IE. However, when I use my iPhone using the same domain, it goes to the master site and not the slave one.

ANy ideas?

If you see the master, this probably mean that the URL is not defined in JMS.

For example, ensure that you have defined the domain with and without the WWW

A tips to know the domain, use the "hello.php" - see the tutorial video 7
It will show you the domain that is received and you will be able to cross-check with the domain name that you have entered in your slave site definition.
