creating a php file for plug-in search/replace

Posted by masvenssons - 2014/01/22 14:26

Have found this code sample, but cant get it to work.
Need help!

This kind of file must be stored somewhere in you website and you have setup the Search/Replace plugin with path to this file.

Perhaps that the Power Point can help you use it.
https://www.jms2win.com/media/joomla_multisites/jd-fr2013_SearchReplace_en.pps

Just replace the

Search1=replace value1
Search2=replace value2

lines by your specific Search/Replace values.

Thanks! It worked.
I have put in File name #1: {root}/media/sr/search_replace.php.
I tried the same thing with {host}/media/sr/search_replace.php, but it didnt work.

In the second case, verify that the path exists on your disk.
Remember that {host} is something like "www.domain.com" and that it does not start by something like /home/account/..... or other directory

In general the {host} keyword is used as suffix and not as prefix in the file name.

_____

Excellent! This is what I did:
I have put in File name #1: {root}/media/sr/search_replace{host}.php
Hve also uploaded 2 files, search_replacewww.mydomain.com.php and search_replacewww.myotherdomain.com.php.

Thanks!
