

Joomla 1.6 alpha2 partial compatibility

In this jms multisite for joomla release we have extended our partial joomla 1.6 alpha1 to the joomla 1.6 alpha2.

Like with the alpha1 you can create slave site and re-install extension in slave site. You can not un-install extension from a slave site once it is installed. To uninstall the extension in a slave site, you have to use the JMS tools when this extension is defined.

FTP Layer parameters redefinition for a slave site

When the FTP layer is required to create and deploy slave site, it was not easy to have the slave site configuration.php adapted with new "FTP root" directory or other parameters.

In JMS 1.2.13 we have introduced the possibility to modify the "FTP parameters" written in the slave site configuration.

In JMS 1.2.14, it is now also possible to replace the default "FTP Parameters" defined in the JMS templates or, when not defined, present in the website configuration.php file replicated.

Bundled with JMS Patch Definition 1.2.20.

The JMS Tools (install) now contains the definitions for :

- Editor Button - Add to Menu
- AdminBar Docker
- Advanced Modules
- Cache Cleaner
- BreezingForms
- Ignite Gallery
- JA Content Slider
- JA Slideshow2
- ProJoom Installer & Smart Flash Header
- RokBox
- RokModuleOrder
- RokModule
- RSSEO
- Tag Meta
- Zoo

Also add the sharing definition for:

- Remository
