virtuemart sharing

Posted by muskes - 2009/01/05 01:11

Hello,

is it possible to share with all slave sites one virtuemart installation on the mastersite?

I want to offer my retailers a website, in which they can have their own content, articles.. and just the shop (the products) will automatically updated by me.

Is this possible?

Best Regards

Muskes

Dear Muskes,

In VirtueMart, there is a special configuration feature that allows to give the URL and SECURE URL that must be used.

See the VirtueMart / Admin / Configuration - panel Security

May be this will do what you are looking for.

Regards
Edwin

Dear Edwin,

thank you for your prompt answer, but this doesn´t work - I tested it. When I change the urls the user jump to the mastersite.

I need a tool/script which synchronizes predefined tables from the master db with the slave db´s (e.g. like this master_vm_products -> slave1/2/3/..._vm_products) everytime when I make a productupdate.

Best Regards,

muskes

Note: is it possible to receive quotas for testings?

Sorry but JMS does not share the website content.
So sharing or synchronise the VM products tables is not present in JMS.

We only have another product "Articles sharing" to display the articles from any webiste but nothing for VirtueMart that could be used to share or synchronize the vm_products.

Hello,

I'm also interested into this feature.
Do you plan to do a component/plugin for that ?

Regards

We will analyse this requirement but with current level of our knowledge, the solution does not seems easy and we don't think to be able to propose such solution at short term.

Hi muskes ,

May you consider to use some Mysql database synchronizing tools to synchronize the VirtueMart database?

There are many those Open Source Tools in the market, such as Talend (http://www.talend.com/index.php), apatar (http://www.apatar.com/) , snaplogic (https://www.snaplogic.org).

Hope it can help.B)

Seth

We hope to propose a real sharing system in coming month for different component like VirtueMart.
We say sharing and not synchronisation.
We can not commite on a date because we need to check some technical point.
This will probably require MySQL 5.0 and will share the website when present in the same DB (case of current replication).
We prefer to avoid synchronisation that require to replicate the data and could cause problem of consistency.
The particular case of VirtueMart is that we have to first provide a real user sharing before extend the sharing to other component.
We have a good view concerning VirtueMart sharing but we have not yet have solved the problem related to the VirtueMart login and VirtueMart user creation.

This is a very attractive feature! Pls notify us once there is a schedule.

Thanks.

Seth
