Generating a folder inside another

Posted by andre.mello - 2012/11/28 17:31

Hello everybody

I'm trying to create a slave site that works, but the url does not work chosen for me. And for some reason, when I generate a new website, a folder is created within another ID as chosen in case AndersonTeste.

See the print I took from the FTP:
http://img37.imageshack.us/img37/4930/ftpv.jpg

Uploaded with ImageShack.us

I tested on all models and continues with this weird error. Anyone know what could it be?

Looks like you are using {site_id_letters} as part of your deployment directory path. Try just using {site_id}

The structure that you have is the one that you get when you enable the "letter tree" functionality in JMS.

So this directory structure is absolutely normal.

If you want to have a "flat" directory structure, disable the "letter tree".
See the "multisites.cfg.php" configuration file.
