Zoolander plugins incompatibility?

Posted by rossi256 - 2013/09/20 20:13

Hi there,

just bought a zoolander subscription for 200 euros with all those great zoo addons/plugins... now i somehow can not get it to run on my slave sites...
tried to install manually (says can not install cause the extension isn't installed in master site, even though it is)
tried to copy the extensions using the TOOLS option - that way they seem to be copied but none of the items is there in the slave sites.
and tried to discover the extensions and install

got the ZLFW (manager for those extensions) installed by using the tools/copy option but i can not install anything from there - just doesn't work.

any chance to make these tools work?
if not either zoolanders extensions or multisites is not usable for me, which would be bad since i purchased both :(

thanks in advance for any help!
Michael

If you want that I add the definition of Zoo Lander extension in the JMS tool menu, please send me the extensions in the attachement of an email.

See contact us for the email address.
