Slave won't connect

Posted by designhow - 2012/12/07 15:29

Two sites that already exist on separate servers. I want to share articles from master to slave. I installed both multisite and article sharing on both. The master has a folder with the slave site name in the root with config_multisites.php created

Do I need to create the same thing in reverse on the slave? it does not like the path to the master? here is the hello world readout.

hello world script
The current path is "/var/www/vhosts/sweathelp.org/httpdocs"
Symbolic Link is PRESENT on Linux platform

What would I put in the site details on the slave? I get this error

The deployed directory does not exists.

==========

If your websites are on different machine (server), this is normal that the directory present in one server does not exists on the other server.

If you just want to have the "article sharing" reading the other server, you just have to create a kind of "fake" slave site that defined the correct DB connection of the other machine. So that the slave site in the server 1 will be setup with the DB connection of the other website on server 2.

On server 1:
- Create a slave that identify the website 2 present on the server 2 with DB 2

On Server 2
- Create a slave that identify the website 1 present on the server 1 with DB 1
