PHP memory limit to small Please use at least 128M

Posted by MaxDM - 2014/08/26 11:55

Hi There.

I'm using the multisite component for several years in the same web hosting ... but now when I try to access the tab "tool", I get an error in the php memory limit (minimum 128 MB) ..

is this a minimum specifications required by the new version of multisite or maybe my hosting has decided to downgrade the memory limit without notice?

However, what do you recommend ?? I have to ask my hosting to upgrade the memory limit or is there some other solution?

Thank You very much for your help.

Best Regards.

---

this check of memory in JMS 1.3 tools menu exists for a long time go(27-dec-2013).
So this is not new.

If you are able to access the php.ini, you can update the maximum memory.
Sometime, it is also possible to update the size from a htaccess parameter.
