Google Maps API key
Posted by rezamoghtada - 2011/07/02 10:18

Dear Edwin,
I am sharing an extension with many websites and the extension using google map,
I have to use Google Maps API key, so for master site i have no problem but for Slave sites i have error for AIP key,
How can i fix this problem?

The Goolde Maps API key is specific per domain.

If you want to have specific key for each website, you can sometime use the Search/Replace plugin to replace a special keyword that you will decide with the appropriate value for the slave site domain or subdomain.

So that you can have several Google Maps API keys.
See Search/Replace plugin
http://www.jms2win.com/en/component/docman/doc_details/13-search--replace-utility

You could create a rule like
Search for

Replaced by
XXXXXXXXX
specific for each domain

Dear Edwin,
I am sharing a Joomla booking system and one of configuration of the extension is Google map API key,
I seat up google API key for my Master and my master works well but for my Slaves site i have this error:

This web site needs a different Google Maps API key. A new key can be generated at http://code.google.com/apis/maps/signup.html.

I got API key for my Slave site and using Search Replace plugin and use this rule:

Search for

Replaced by
XXXXXXXXX

but i thing i am doing wrong and it doesn't work i wrote like this:
Search for

Replaced by
ABQIAAAA-0GmCKZ2wq2ZUG3ycxss3BStySE45yU5v_0ZViKLmq4V5_UfZRRhjTBPNcsZjLdUQbIoCgyt3visYA

The first IPA key is my Master IPA and the second one is Slave IPA,
What is wrong in this rule?

Also do i have to fill File name #1 and File name #2 too?

Best Regards
Reza

_____

Verify the result generated in your web page (see source HTML) and verify that you have the correct value replaced.

In general is is better to use a keyword instead of the master key to be replaced.
I suspect that you didn't speeled the things correctly and that the search/replace didn't find the pattern.

You can also use file for each sites to define the Search/Replace patterns.

_____

Dear Edwin,
I just wanted to let you know this format:

Search for

Replaced by
XXXXXXXXX

didn't work but this format:

=XXXXXXXXX

works very well,
Anyway thanks a lot for your help.
Regards
Reza

You had effectivelly to read my text and implement the code.
If I had give you a "cryptic" statement you perhaps would not have understood the idea.

So yes you had to know how to use the Search/Replace plugin and its differents methods to perform the Search/Replace.
