This extension is not found in the master site.

Posted by ztian - 2009/02/21 01:33

Hi,

I have been using this great component for a couple of months now, and it has worked well on 7 slave sites as well as the master. Yesterday I installed number 8, but coult not install Joomfish component on the slave site. I got this message:

* This extension is not found in the master site.
* Please install it first in the master site before installing it into the slave site
* Install Component Error

Joomfish is installed on the master site, but have not been in use as this slave site is the only one I need it for so far.. Any ideas why this happen?

The problem is due to the '!' character present in Joom!Fish name that cause a problem to identify the correct name and version of the extension.
This is fixed in the JMS 1.0.16.
To get the latest version, you can go in "Get Latest Version" menu http://www.jms2win.com/get-latest-version and select the product for which you want to get a new download ID. When selected, click on the "Get Latest Version" button in the top right that will resend you a new Download ID.

Hello,
I installed Joomla 3.2.1 and JMS2WIN 1.3.29.
I created a slave site with a template directory being a copy, not a symbolic link.
I tried to install several templates, for example "favourite"
(http://www.joomlaperfect.com/favourite-favthemes)
The following error mesage appears each time :

Message

This extension is not found in the master site.
Please install it first in the master site before installing it into the slave site

Error installing template

Would you, please, have an idea of this problem ?
Thanks for your help,

_____

When you create a copy of the "/templates" directory and that you want later to be able installing a template into a specific slave sites, you also need to setup the "template folder = {deploy_dir}/templates".

Otherwise, you will not be able to install any template that would not be already present in the master.
So verify the JMS Template rule / common tab / (4) specific slave site folders => Tempaltes folder field.

_____

Hello,

Thanks for your answer. I added {site_dir}/templates as template directory
In the slave site, libraries are created with "dirlinks", and templates with "copy"

When I install the package of a template, I get a blank page and the following errors in the logs :

PHP Warning:
require_once(/local/Joomla_3.2.1/multisites/slave2/libraries/joomla/installer/adapters/template.php) :
failed to open stream: No such file or directory in
/local/Joomla_3.2.1/administrator/components/com_multisites/libraries/joomla/installer/adapters16/template.php on line 26, referer:
http://bacasable.irit.fr/joomla_jms2win/multisites/slave2/administrator/index.php?option=com_installer

PHP Fatal error: require_once() : Failed opening required
'/local/Joomla_3.2.1/multisites/slave2/libraries/joomla/installer/adapters/template.php'
(include_path='.:..:../..:/usr/share/pear') in
/local/Joomla_3.2.1/administrator/components/com_multisites/libraries/joomla/installer/adapters16/template.php on line 26, referer:
http://bacasable.irit.fr/joomla_jms2win/multisites/slave2/administrator/index.php?option=com_installer

I checked the directories, and there is no installer directory in libraries/joomla

Would you know what is wrong ? Thanks for your help

Some additional information about /xx/multisites/slave2/libraries/joomla/installer/adapters/template.php missing.
installer directory exists, but in :
./tmp/jms2win/admin/libraries/joomla/installer/adapters/template.php
./administrator/components/com_multisites/libraries/joomla/installer/adapters/template.php

Could it be a problem of path ?

This is NOT {site_dir}/templates but {deploy_dir}/templates that you have to use when you deploy a website into a specific directory.

If you have put a value in the "deploy folder" then
Solution 1 (make subdirectory with symbolic links)
- Folder tabs / set action = "special copy"
- Common tabs / template folder = {deploy_dir}/templates

Solution 2 (make subdirectory with a copy)
- Folder tabs / set action = "copy"
- Common tabs / template folder = {deploy_dir}/templates

When the common "deploy folder" is empty, again 2 solution but replace {deploy_dir} by {site_dir}
- Folder tabs / all action = "ignore"
  except action for templates = "special copy"
- Common tabs / template folder = {site_dir}/templates

Concerning the PHP Fatal error, can you confirm that you are using the latest JMS 1.3.29.
If this is not the case, see the FAQ for the procedure to get the latest version.
https://www.jms2win.com/en/faq/faq-joomla-multi-sites#cat-122

Re:This extension is not found in the master site.

Posted by pocquet - 2014/03/21 15:50

I do confirm that I am using the latest JMS 1.3.29.

I changed into {deploy_dir}/templates, but the problem remains unchanged.
The configuration is :

- Main site : /local/Joomla_3.2.1
- Slave site : /local/Joomla_3.2.1/multisites/slave2

Slave template :
1. Common :
- Domain names : http://{site_url}/multisites/{site_id}
- Directories :
--- deployment : {site_dir} which is the same than {multisites}{site_id}
--- template directory : {deploy_dir}/templates

2. Files and directories :
- templates : copy

Thanks a lot for your help .

_____

Based on what I read here, it seems that the definition that you did is
Site ID = slave2
Template = xxxxMultisites

I also see local in the path.
I am wondering if you are working on a "localhost" of if you are working on internet.

Which platform do you use ?
Do you use a linux, or windows or something else ?

When you check the files and folder on the disk, do you have a physical directory for
/local/Joomla_3.2.1/multisites/slave2/templates
or a symbolic link
or a physical directory with inside symbolic links.

The expected result is a physical directory for the "/templates" directory and inside either a copy or symbolic link depending on the JMS action on /templates (copy or special copy).
