Pre-Sales Question

Posted by Worsin - 2009/03/26 20:26

I am heading up the development of a huge website network involving Auto-Replicated Joomla! websites.

This site is based around a Multi Level Marketing program where as people are to receive a free website all set up for them upon sign up. We plan on doing this using a script of some sort that is triggered by separate software we are having made.

My question to you is how easily could a script be created for your software that essentially set up a new website for someone automatically?

We are willing to pay well for such a script to be created to work with this software.

We want to be able to support 1000's of Auto Created Joomla! Websites from 1 interface. Saving a ton of space sounds good also!!

Regards

Troy Thomas

This is possible and can be acheived by several method.
- First JMS propose a full system that allow create website from the front-end.
You can also call you specific script from JMS when creating the website from the front-end.
It is also possible to execute special Plugin to do special task.
We have developed one that create a bridge to VirtueMart in aim to let VirtueMart manage the ordering and the payment.

You could also develop you specific interface and call JMS low level function to create the website.

For example we have recently develop for a customer a "batch website generation" to allow create automatically 1000 dealers websites based on an existing one.

We are ready to develop specific things and also provide specific support if required.
You can find our price support in the Joomla Extensions menu.
http://www.jms2win.com/download?page=shop.browse&category_id=1

JMS propose also the possibility to give a validity duration for the creation of website.

Most of you request is possible in standard with JMS.
If you want to have your own interface, you could develop a specific component or template to revamp the JMS look.

I suggest you have a look to the video present in the tutorial step 13 that present the creation of website from the front-end.
