replicated slave site wiil not load

Posted by 27midwest1 - 2009/05/16 17:36

Hey, what would cause a replicated slave site not to load. The site was created from a working template and everything was working fine, then all of a sudden I go to the following url http://ecampbell.reshapingu.net and I get nothing. I can access the back end but I get nothing once I put the url in the browser and I currently have 2 sites that are like this.

I don't know what is the problem as I use the URL that you provided and I have received a front-end webpage.
There is a red bottle in the bottom of the front-epage.

Perhaps you should cleanup your browser cache ?

Hi 27midwest1,

I can also see your webpage at the URL, too.

I have experienced similar things when I was using JMS1.1.16. Those slaved sites were somehow linked to the Master Site. I guessed it is related to the Cache. So I cleared and turned off the cache. Those slave sites were then crashed, and could not be accessed anymore. Just Blank pages.

I'm not sure why. Then I deployed JMS and built the slaved sites again with NO Cache.

Now everything fines!

I turn on SEF, fine tune the SQL and fine tune my apach server to increase the Joomla performance. With No cache.

Hope this can help.

Cheers,

Seth

_____

When using the cache, it is recommended to deploy the slave site into a specific directory and also setup apache to have a documentroot that correspond to this specific directory.

In such a way, you keep the standard Joomla structure that is:
- document root
- document root / cache directory

If you don't have specific directory for each website, it may be happen that you share the same cache for several websites.
