Hey, what would cause a replicated slave site not to load. The site was created from a working template and everything was working fine, then all of a sudden I go to the following url http://ecampbell.reshapingu.net and I get nothing. I can access the back end but I get nothing once I put the url in the browser and I currently have 2 sites that are like this.

Re:replicated slave site wiil not load Posted by edwin2win - 2009/05/16 21:31

I don't know what is the problem as I use the URL that you provided and I have received a front-end webpage.

There is a red bottle in the bottom of the front-epage.

Perhaps you should cleanup your browser cache?

Re:replicated slave site wiil not load Posted by KingoftheRoad - 2009/05/17 07:08

Hi 27midwest1,

I can also see your webpage at the URL, too.

I have experienced similar things when I was using JMS1.1.16. Those slaved sites were somehow linked to the Master Site. I guessed it is related to the Cache. So I cleared and turned off the cache. Those slave sites were then crashed, and could not be accessed anymore. Just Blank pages.

I'm not sure why. Then I deployed JMS and built the slaved sites again with NO Cache.

Now everything fines!

I turn on SEF, fine tune the SQL and fine tune my apach server to increase the Joomla performance. With No cache.

Hope this can help.

Cheers.

Seth

.....

When using the cache, it is recommended to deploy the slave site into a specific directory and also setup apache to have a documentroot that correspond to this specific directory.

In such a way, you keep the standard Joomla structure that is:

- document root
- document root / cache directory

If you don't have specific directory for each website, it may be happen that you share the same cache for several websites.
