Can 2 URLS run off the same database?

Posted by gogogadget - 2009/04/18 01:44

I run a site called www.mysite.com. www.hissite.com would like to use all of my content but does not want the URL to be displayed as www.mysite.com. Is it possible to keep www.mysite.com in tact and have www.hissite.com use my content without too much disturbance to the process?

Is this what this solution does? Is there any easier solution outside of buying this product?

If I understand well, you want to have 2 domain names (www.mysite.com and www.hissite.com) that share the same website.

If this is the case, I think you don't need JMS.
You just have to update your hosting server that make both domain as synonyms.
Have a look the JMS concept present in the tutorial step 0 video.
http://www.jms2win.com/tutorial

Also have a look to the "hosting configuration" present in the FAQ
