Jomsocial user images are not shared
Posted by joekker - 2012/05/10 09:22

Dear Edwin,

I have slave/master sites with Jomsocial shared except the configuration.
Users and their infos are shared correctly, but their photos in the albums are not.

Did I make wrong something ot that is the correct behaviour?
I hope I did. I have built up a conception on shared Jomsocial users and worked months on it.

I would really need a quick help!

Thank you!

Jozsef

Done!
It was my fault. I did created own images folder for all sites.
So it fixed.

Sorry about that!

Jozsef

No problem.
This may help other people that would have put specific images folder and would have the same issue.

Now, as I have already cretaed my slave site with a specific image folder, what is the correct way to

update the site make it use the master image folder instead of the own?
Or the only solution is deleting the site and recreate it?

Thanks for help!

_____

You have to change the JMS template rule that you used to build the slave site and mention that you want "Special Copy" for the "images" folder.

When done, you will have to remove manually the "/images" directory present in your slave site (or rename it - just in case to recover it)
AND after that, re-open the JMS slave site definition to save it again.
JMS will detect that the "/images" is no more present and will read the JMS template action to know how to rebuild the "/images" directory. Here the action is now "Special Copy". This will create a symbolic link.
