Menu management
Posted by ratul - 2009/07/20 16:38

I have already installed multi site component. And create two different domian. Now I need to create one menu in one domain and share it to other domain.

Please help how can I do it.

Thanks in advance.

You have to provide a full URL (external link) as you should have to do for any external website.

OR,

you can buy the Multi Sites Menu Item extension that provide the facility to compute that for you.
http://www.jms2win.com/download?page=shop.product_details&flypage=flypage.tpl&product_id=36&category_id=1

This extension read the target DB website and compute directly the full URL for you.

This avoid to update the calling URL when you update your target menu item as it is computed automatically. Otherwise, you shoud have to update each website where you reference a menu entry.

More less.

In fact, you put the definition of the menu in the website where you want to display something.
The other website just get the reference to this menu.

So you have to create such reference menu in each wesbsite and after that, you can modify the defintion of the target website.

Example:

Slave 1:
You define a menu entry called "slave1 Article" that display the article with ID=123
For example the the menu item crated in this slave site received the id=45

In slave 2:
You use the Multi Sites Menu Item and you connect on the slave 1 website.
There, you select the menu item with ID = 45.

JMS will compute the full URL based on the menu definition present in the slave 1.
This mean that it will display the article with the ID=123

Imagine that you decide to change the article in the slave 1 website and that now you select the article 678.
Autmatically, the menu definition in slave 2 will use this new article ID=678.
