Component not found in master site

Posted by neales - 2009/07/31 18:22

Trying to upload the component 'rereplacer' (http://www.nonumber.nl/rereplacer) to a slave site. It says it is not found in the master site when it is already installed there. Any ideas?

Nick

Dear Nick,

the author of this extension use an experimental installer that they have created and that cause problem to be installed under JMS automatically.

You can have a look in their website and they publish themselve an alternate procedure to install their component.

You can also have a look in a reply I have given for another extension published by this company.
See forum http://www.jms2win.com/forum?func=view&id=582&catid=3

The problem with this author is that they have developed a fake component called "com_nonumber-installer-UNINSTALLME" that is used to install the component itself.

When the component is installed, they delete this "temporary" component but in Joomla they keep the name of this temporary extension.

Therefore when JMS want to re-install the extension in a slave site, it retreive from Joomla the name of the temporary extension that they have deleted.

This explain why you have to unzip this extension in to a directory of the Joomla administration to restore this temporary installer.
This will allow JMS retreive its version number and previous installation and will allow the re-install in the slave site.

I got this to work, but please note that it is case sensitive, and uninstallme should be in lowercase, and you only want the content of the zip file after the rereplacer2.9.2 directory.

Rereplacer is a very useful component if you're doing a complex JMS multisite implementation

_____

ReReplacer is defined in the JMS tools for several month.
So I don't understand your post.
Did you try to re-install ReReplacer into the slave site back-end ?
If YES, I don't understand how you were be able to re-install it.
