JMS Menu Item V1.0.1

Posted by chrissy6930 - 2009/10/13 12:04

---

hi there,

I have my test session installed in a subfolder of public_html

when I now enter the master domain into the params field of the menu item component :
www.mysite.com/testing
upon saving it will be adjusted for
www.mysite.comtesting

what should I do if my test session is set up like this? i.e. how can I prevent the slash from being truncated?

Your description is not clear.
Can you give me a screenshot of the place where you enter the params in the Menu Item.

You put this URL for which king of Menu Item (this is not specified).
Is it an external menu itme type ?

sorry

I mean in the Master I go to Components - Multi Sites Menu Item - Parameters

asks me to enter the domain name of the Master

Now that I see where you enter the parameter, I am now able to reproduce it.
So I confirm this is a bug that I will fix asap.

You can download the JMS 1.0.2 that fix this bug.
See procedure in FAQ - get latest version
http://www.jms2win.com/faq#sec-122
