domain name---
Posted by chrissy6930 - 2009/10/17 09:17

---

hi there,

I have created a template and have now created a slave using it

however instead of

http://{site_url}/multisites/{site_id}

I would like to use

http://{site_url}/creators/{site_id}

as the domain name

only what would I need to do to getting this to work?
so far it is returning the error 'The page isn't redirecting properly'

Again like in your previous post with 403, follow the same procedure.

- Check the URL
- Check that you can access the URL with a hello word
- Once you are sure of your URL, check that you have deployed the slave site in the corresponding directory (that is dsplayed by hello word).
- Review your JMS definition according to all the previous infos collected.

Review also the video and listen them carefully.

---

well I have deployed it to

{root}/multisites/{site_id}

and when checking the hello.txt

on the the domain

{site_url}/multisites/{site_id}
it returns 'hello world (chrissy6930)

while on the domain
{site_url}/creators/{site_id}
the error
The requested URL /testing-jms/creators/chrissy6930/hello.txt was not found on this server.
is being displayed

however its the latter domain name I would like to use

_____

If the URL is {site_url}/creators/{site_id}
Then you have to deploy in this directory and not in another one.

{root}/creators/{site_id}

_____

ahhh! would I need to create that folder first or will it be as soon as I deploy to that directory? or would it work by merely renaming folder multisites?

_____

hm!

I have now tried

editing slave adjusting deplayed folder to

{root}/creators/{site_id}

returns the error

The deployed directory ../htdocs/testing-jms/creators/chrissy6930] does not exists.

if instead I first create folder 'creators' in the root first and then edit the slave adjusting the deployed folder as above I would get the same error

could you please advice how to properly deploy to folder 'creators' ?

All I can tell you is to review the video CP-04 that show you all the step of the creation and what you have to check.

If you don't deploy the slave site in the correct directory that is the one that you can discover yourself with the "hello.php" and that I have already explained twice to you then I can only suggest you is to order our billable support on
http://www.jms2win.com/download?page=shop.product_details&flypage=flypage.tpl&product_id=35&category_id=1

For the last time, I repeat again.
- Place a file like the hello.txt into the directory where you think the domain should replie
- Once you know this direcrtory, deploy the slave site into this directory
- Check that you have correctly deployed everything in this directory.

If you where able to launch the "hello.php" in this directory, you can also launch the "index.php".
