observation when upgrading JMS component

Posted by chrissy6930 - 2009/10/20 13:27

---

hi there,

so far I have upgraded the component twice on my test session. and while installing the new version on top of the exisitng one following the instructions provided is working the folder structure is changing

initially only the installation folder and the multisites folder are there

after 2 upgrades however I have
installation
installation_to_delete
installation_to_delete_1

any chance you would know how to avoid this?

JMS does not delete the "older" installation and just rename them.
This is just in case where you would have something special in those installation directory.
You can delete the "to_delete" one manually if you want.
Just keep the "installation" that is required to install fresh slave sites.
