Same prefix and db for slaves sites
Posted by lombras - 2010/02/07 15:33

Hello,

I need slaves load the contents of the tables from the master site, without replicate tables, because they will be identical, if i replicate, will generate redundant data in the db.

its possible?

Thanks!

YES this is possible for a limited number of extensions.
When you share extension, JMS use a MySQL feature to share the table and avoid dupliaction of information.

See the list of extension in
http://www.jms2win.com/component/content/article/135

Most of the extension that can be share require also to share the joomla users.
The sharing is a decision that is taken when you create the slave site and that can not be modified later.
This impact the way that the DB tables are created.

Ok! Thank you!

I need share the tables #__content , #__menu, and the tables where the module positions are save.

Can i do this by rules in template configuration??

NO.

JMS does not share these tables and you can not do it.
