| Is it possible to replicate components like community builder but without to replicate the users which are in community builder database?                                                                                                  |

| YES. You just have to create a Fresh Slave site that contain a "template website" pre-installed with Community Builder and without any user except the administrator. After that you can replicate this website as many times as you want. |

| Can I make copy of a existing website which is with installed modules and after that I can delete all users and data which I doesn't want. Then I can copy this template site.                                                             |

| exact. This is the idea behind the "templates of websites"                                                                                                                                                                                 |
