---

installing a extension on children site.

Edwin,

this never happened to me before... but while i was trying to install jfbconnect in one of the children sites. i has this error.

Master site name: template
slave site name: lasveags

* It was not possible to copy the selected file.
* JInstaller::install: Failed to copy file: /home/localizit/public_html/template/multisites/lasvegas/tmp/install_4bec21e837586/com_jfbconnect/component/index.html to /home/localizit/public_html/template/components/com_jfbconnect/index.html

instead of copying it to /home/localizit/public_html/template/multisites/lasvegas/components/com_jfbconnect/index.html

it's copying it to: /home/localizit/public_html/template/components/com_jfbconnect/index.html

please advice.

i checked the tmp and other basic configuration came in my mind and all of it looks ok to me.

also, the same version of jfbconnect is also installed on the master site.

==========

This is probably due to a permission error.
So check the owner of the file and perhaps also the chmod
