Retrieve Site ID (Multisites ID Plugin) via PHP
Posted by mediacake - 2010/06/05 16:31

I'm using JMS in combination with Fabrik. I have a Fabrik element that I need to populate with the JMS site ID. What is the PHP code that I need to run on the Fabrik element to retrieve that value?

You can either use a hidden field for which you assign a specifc default value like {{site_id}} and combine it with the Multisites ID plugin or directory code in PHP the behavior for a special field type that would be computed base on the MULTISITES_ID define. When it is defined, it contain the site_id otherwise, this is the master.

I've tried using {{site_id}} as the field value, but it just evaluates to "{{site_id}}". Could you give me some example PHP code that would let me retrieve this value?

---

this is explained in my previous post. If you are a PHP developer, you should know what mean "use the define MULTISITES_ID".
Read the PHP multisites ID plugin code if you want to see how to do.

$variable = MULTISITES_ID;

It's not a good idea to alienate your paying customers. I'm a PHP developer out of necessity, and relatively inexperienced. I'm also used to forums where paid customers receive the answers and the help they're looking for from the developers/admins. A few lines of code that you already know how to write would be much quicker and more helpful than saying " should know what mean". I guess I'll try to

figure it out and post back here when it's working so that other people wondering how to do this will have functional example to work from.

_____

Working Example:

```
if(defined('MULTISITES_ID')) {
  return constant('MULTISITES_ID');
} else {
  return ':master_db:';
}
```

Tested this on the master site, a slave template site and a general slave site and all is well. Hope it helps someone.
