# Menu Items Problems

---

Hello,

I've installed the Menu Item Component on my master site, and then in Multisites, Tools, subsite, I installed from master to get it on my subsite as well.

I did add the master url to the parameters area of the menu item component in both sites. But when I click save, the placeholder www.masterdomain.com just reappears. So it does not appear to be saving what I enter for the master domain.

I tried to create a menu item with the menu item bridge, but the link doesn't work. When I hover the menu link, the url appears correct:
http://mysubsitedomain.com/index.php?option=com_multisitesmenuitem&view=redirect&site_id=:master_db:&id=5&Itemid=13

But when I actually click on it, the browser redirects to:
http://index.php/?option=com_content&view=article&id=79&Itemid=5

And of course this is an invalid url.

I'm attaching a screenshot of my admin->Multisites Menu Item -> Parameters screen

Any clues anyone?

==========

Reveiw the menu item back-end and enter a valid URL domain corresonding to the master website.
