site_id - domain - mysql ?
Posted by eddiex - 2011/06/26 12:04

Do anyone know what DB that contain domain name / site name?

I know its mysql :-) but what prefix?

I ran thru all Master_ but I didnt find anything.

Greetings Eddie

There is no DB to store the domain and site ID information as such information are required before to open a DB.
The information are stored in files on the disk and managed by Jms Multi Sites.

The site ID is a directory name.

Hi,

ok, tnx... I just wanted to publish a list of the slave site... with possible a html link to the sites..

Any simple way to do that???

(I tryed the list slave site, but it shows to mutch... then I tryed to "read" the names from mysql),..

Greetings Eddie..

You can already have the list of slave site when you create a menu item using the "multi site" menu.

It is also possible to create a JMS "layout" to publish such list.
We are currently creating a "List Anonymous Layout" that is doing something similar to a "google query result".

_____

hi,

ok,

What I really want is a "module" or a menu on the left/rigth witch shows the slave sites in HTML links ....

How to fix???

Greetings Eddie

_____

This require to develop something specific.
We create internally a "Multisites Jump To" plugin that is able to create a combo box with the list of slave site that are available and "jump to" the appropriate website.

This is still an internal development and not yet a product.

If you want a specific development, this is also possible with our billable support that you can order at http://www.jms2win.com/en/joomla-multisite?page=shop.product_details&flypage=flypage_multisites.tpl&product_id=35&category_id=1
