

## Pre-Sales Question(Parent, Children, Grandchildren

Posted by oasisfleeting - 2011/07/18 16:43

---

After doing some reading on the site and watching a few tutorial videos. I've come up with this scheme for what I'm trying to do. (Diagram Attached)

[http://www.acoolsip.com/images/spice\\_pub\\_site\\_scheme.png](http://www.acoolsip.com/images/spice_pub_site_scheme.png)

What I am thinking is this:

I have already built an extension that enables admins to moderate and classify media uploaded to jomsocial. The classifications are A-F and they are mapped in the database by their ids.

I will build a plugin that overrides jomsocial controllers and models and restrict media based on that medias classification A-F. Each Slave A-F will get it's own respective plugin which restricts media.

After I have each slave set up I will want to basically subclass those slaves in essence creating grandchildren of the master site.

Each grandchild will mirror it's parents (slave a-f) actions in regards to restricting media.

I suppose I'm just looking for confirmation as to whether or not JMS is right for me?

With JMS, you can effectively create a large number of slave site and replicate them based on a parent. So you can effectively create different group of slave site with the same joomla PHP code (installation).

We think that JMS can effectively help you acheive this objective.
