synchronize slave and master - after upgrades

Posted by diogowernik - 2012/04/05 13:09

---

hello,

i did some changes in the master, i unistalled some components and upgraded others, also i upgraded jms...

joomla 2.5.4
jms - last version
seblod - upgrade last version

the website is not upgrading and the unistalling in the slaves! do you have any types how to do this synchronization...

If needed more information i can give

thanks

Look like that all site was updated only the seblod that wasn't...

do you have any tip for this case?

When there is an upgrade of an extension that impact the MySQL table layout, you have to re-install the extension in the slave site to allow the extension applying the DB modification.

Concerning Joomla itself, there is now in Joomla 2.5 a new "extension manager" / database / fix button that allow to fix the DB layout when there are upgrade.
You have to re-apply the procedure in each slave site to fix the DB layout.

---

thank you for reply!

the joomla database i have already fixed, looks working fine!

the component i'm trying to install but i get this message:

> This extension is not found in the master site.
> Please install it first in the master site before installing it into the slave site
> Error installing package

but it is already installed in the master! Any idea?

_____

I'm getting the same thing with a template I installed. I know it is installed in the master as I can use it but in the slave it is telling me it cannot be installed as its not in the master. The template installs extensions and some other items. The link to what I have installed is below. Any help would be great as I'm new to Joomla.

_____

If you are not able to install the extension in the slave site and that you have a message that report that it does not exists in the master, this mean that it DOES NOT EXISTS.

Recently some authors, have developed their own installer to replace the joomla installer and use a temporary or fake installer to install the final extension.
When they proceed like that, when they finish to install the final extension, the remove the "temporary" installer.
In this case, this is normal that you can not install them from a slave site as they have removed their "temporary" installer.

This is the case of "no number" but recently also from Rocket Themes that can no more be installed from a slave site. In the case of Rocket Themes, they also does NOT allow to discover the extension from the standard joomla 2.5.

So report any issue concerning such behavior to the author of the extension as this is a consequence of trying bypass the standard joomla installer.

Ok yes after looking further into the template it is a gantry mod which seems to be an issue with jms2win. But just to say IT DOES NOT EXIST is not a good answer as I can use it in the master so IT DOES EXIST. In the slave the template shows in "template manager/templates" but not in "template manager/styles" if this helps you in anyway. I am very new to Joomla and even newer to this multisite module/plugin whatever it is. Its working very good on everything I want apart from this one template for another website. I'll see if they can come up with an answer but if you could help with the install of the gantry stuff or point me in the right direction to get it running in slaves I would appreciate it.

If you have a look in detail in the gantry module, you will see that it uses an "installer" component that DOES NOT exists in the master because Rocket Themes deleted it.

As I have already explained, recently Rocket Themes created a new installer that bypass Joomla installer and that is deleted after used.
So this is normal that it does NOT exists in the master as Rocket Themes had deleted.

If you are using Joomla 2.5, try using the "Extension Manager" / "Discover" but I think it also fail as the RT installer is not present.
Report the issue to Rocket themes.

If the module is defined in the JMS Tool menu, you can install it from the "Tool" menu.
Otherwise, send me the extension in the attachement of an email and I will have a look if I can add its definition in the JMS tool menu.
When this concern a module (not a component), in general, you can just define the extension with the JMS Tool menu as this assume that the content is already present from a component.

Hi,

Ok that's better an explanation. Sorry if I sounded off but now you have said what the issue is I can understand why it's saying what it does.

Thanks

_____

In your orginal question, you didn't mentioned the word Gantry and I can only provide a generic answer. As soon as you have mentioned the word Gantry, the answer can be more precised because we spoken of a specific case that had a name. (Gantry latest version).
