

Multilanguage with Joomla 2.5 en Jms2Win 1.2

Posted by Alaink - 2012/08/29 17:20

Hi,

When I create a new slave, I have a new trouble (since I have published the "classic" multilanguage module from Joomla 2.5)

When I write : <http://www.travel-pro.be/Thuisindewereld/>, the navigator changes to : <http://www.travel-pro.be/nl/Thuisindewereld/nl>, and I receive a 404 code page error.

With a "classic" domain name, I have also (now) a problem : page 404 (example : <http://www.reizenanny.be/>)

For the old slave site, all still correct.

Any idea ?

Thanks,

Alain

The standard Joomla language module automatically redirects the user to a subdirectory NL or other depending on the browser's accepted language.

So if you are using a browser setup "nederlands" then you are redirected to "domains.com/nl".

The error 404 is perhaps due to the .htaccess files that are missing.
