# MultiSite ArticleSharing - wrong content

Posted by Mattz - 2012/11/28 17:17

---

Hello, i am actually trying to use the MS ArticleSharing-Extension, using contents from slave site 1 to bring them up on slave site 2. The problem is, that sometimes (50/50) it displays the wrong content, although i selected the right one in the content selection. Also the article title shown after selection in the "select article"-field is even wrong (not identical with the one i've chosen) oder simply missing.

It seems as if the extension refers to old or outdated or simply wrong database-entries of content-ids.

How can i get rid of this problame, as we're planning to use this extension on several parts of wour websites.

Best,
Mattz.

Concerning the rendering that you seems report that it display the wrong content, perhaps this is related to a cache problem with your template.

Anyway, we have released a new Article Sharing version 1.1.8 that fix some issues reported by other customers like the "read more" button that was not correctly displayed.
I suggest that you try this latest version 1.1.8 to see if you still have the problem.
See the FAQ for the procedure to get the latest version.
