errors with Server move and existing JMS install

Posted by jamesbbb - 2013/10/28 00:34

I have moved a master and slave domain from one server to another this was done via a WHM complete backup/restore the only thing which has changed is both domains are on the same IP now, where as previously they were on separate IP addresses. everything else is the same - user accounts, directories, databases, etc.

however, the slave domain now shows the content from the master domain.

Where should I look first to resolve this issue ?

cheers James

Several potential reason:

- Verify that you have correctly speeled the domain name (with and without WWW) - You can use the

"hello.php" tutorial video 7 to help you verifying the domain name and location on the disk

- Verify that you saved the slave site with success (blue or green) message

⁻ Verify that the JMS patches are installed
