templates in slave site
Posted by robov - 2009/10/08 20:47

I deployed a siteto var/www/master/www/test
then I copied to var/www/slave/www/

both the image and template folders are no symbolic links

So now I have a site that works...

However when I now try to install a new template I get:
* This extension is not found in the master site.
* Please install it first in the master site before installing it into the slave site
* Install Template Error

and the wierd thing... it was also installed on the master site

Any suggestions?

---

and when i try to remove a template from the slave then:

* It is not possible to remove a slave site template.
* To remove the template, you have to remove it from the master site
* Uninstall Template Error

If in JMS you have not provided a specific directory for the tempalte, this is normal
See the tutorial video CP-05
http://www.jms2win.com/tutorial#jms12x-CP-05

You are not autorized to un-installed a template that is exclusivelly own by the master.
By default, you share all the files and folders on the disk.

I suggest that you start to have a look in ALL the videos present in the tutorial and also try to understand the concept as described in video 0.

You should find the answer to all your questions
