Class 'JConfig_' not found in jms2winfactory.php

Posted by mfc48 - 2009/12/10 10:13

Hi,

I'm using multisites and article sharing. I have created a master site and two fresh slave sites (stored on master server but using addon domains) on seperate domains.

When i try to access any of the shared articles on the slave sites i get the following error:

Fatal error: Class 'JConfig_' not found in /administrator/components/com_multisites/libraries/joomla/jms2winfactory.php on line 104

Master site is fine. And normal content is fine, just the shared articles that are causing this problem. Any idea what could be causing this?

Thanks,
J

I have the same error.

In Master site, I can create a new menu using the Articles from the Slave site. But I want my slave to create a new menu using the article from the Master/Template site.

Am I understanding it right? The slave site will be able to create a New menu item to show the articles from the Master/Template site.

Let us know.
EM:huh:

The reason is an invalid configuration.php files that has a PHP syntax error and that does not allow to be processed by PHP.
The most frequent reason is that you have entered a text in the title of the site containing an apostrophe.

Check the sitename, fromname and MetaDesc that are the most frequent fields that could create an error.

Here it is a sample

correct -> var $sitename = 'localhost - JMS2Win - Slave 1';
incorrect -> var $sitename = 'localhost - 'JMS2Win' - Slave 1';

The error is that apostrophe is added around 'JMS2Win'

Share articles but also multisite menu item, reads all the configuration.php of all the slave sites defined under JMS.
The error can be located in any slave sites configuration.php file.

If you have a PHP debugger application, you can just open each configuration.php files to see which one contain a PHP syntax error.

To identify which configuration.php has the error, you can rename them into "old" and restore their "configuration.php" name one by one until you discover which configuration.php file contain the syntax error

Check also that configuration.php file contain a PHP end marker at the end of the files "?>"

If this error occurs in the "Article Sharing for JMS" and only in a slave site, you should check the wrapper of the master configuration.php file.
Perhaps you will have two wrapper inside the files (a old JMS wrapper and the new JMS wrapper 1.2.14)

Normally you should have

The comment
//_jms2win_begin v1.2.14
must directly follow the

I have the same error message. But, I know why I'm getting the error. I moved to a new server and the server path to the www folder has changed.

Old path: /home/e-smith/files/ibays/Primary/html/configuration.php

New Path: /var/www/configuration.php

How can I update Multi Sites with this path change? I tried re-installing Multi-Sites and it did not change this path. (I'm hoping it is saved in a config file somewhere and is easily changed)

Thanks,

Shane

First, check the version of JMS that you are using.
Similar problem was solved in recent JMS.

See JMS 1.2.17 release note in the FAQ
http://www.jms2win.com/faq/change-history-v12x

I was running v 1.2.8.
After seeing your post, I installed 1.2.19

Unfortunately, I am still getting the same error.

Warning: fopen(/home/e-smith/files/ibays/Primary/html/configuration.php) : failed to open stream: No such file or directory in /var/www/libraries/joomla/filesystem/file.php on line 240
jms2winfactory.php: Unable to read configuration file

The path has changed. /home/e-smith/files/ibays/Primary/html/configuration.php
is now at: /var/www/configuration.php

Is there another I can 'correct' that path

Now you have an error message that I have solved in the next JMS 1.2.20 that is not yet public because all my internal test are still not OK.

Here it is a workarround to solve this error, you can edit the file /multisites/config_multisites.php and moreless line 5, change the path that is in the "define" line.

This did solve that error message. Is there anywhere else that path older path may be saved?

I'm cannot open the "check patches" area. When I click that link, it hangs for a long time, then times out.

The check for update can either due to the fact that you have not registered the JMS.
Second possible reason is the fact that your server as firewall that does not allow calling our server
Third reason is that you don't have the PHP 'curl" module installed.

Finally if the timeout is still present, you still have the possibilty to get the latest version of JMS that generally is packages with the latest patch definition.

Man! You're right on.
I didn't have PHP curl installed. I installed that module and 'check patches' is working perfectly.

Thanks for your quick replies.
