Permission
Posted by lineacomune - 2010/01/18 16:12

Hi to all, I've installed a slave site with this settings:

- Domain name = {site_url}/multisites/{site_id}
- Deploy directory = {site_dir}

When I go to {site_url}/multisites/{site_id} (the resolved url) I get this error:

Forbidden

You don't have permission to access /multisites/ops/installation/template/css/template.css on this server.

Why?
Thanks a lot
Stefano

When you deploy a slave site into a specific directory with symbolic link, it is required that you have permission to execute the files.

Several reason may cause a "forbidden".
- Check the own permission of the directory
- Check the your apaches allow "followsymlink"
- Sometime server reject execute script when 777 is present;

Check also that the path reported is present and that you have permission to access this files (here the /multisites/ops/installation/template/css/template.css)

You can also try using the "hello world" procedure to check the permission of the directory.
unzip the "hello.txt" and "hello.php" in each directory that you want to check.
This will help you test the permission of your hosting server.
