Sharing Virtuemart
Posted by slboone - 2010/01/23 02:49

Hi Edwin,

I'm using the option to share Virtuemart with my slave sites and so far it is working correctly, however, the template I am using is using a product scroller that accesses the products file of the Slave site instead of the Master where the products are loaded. How can I edit the scroller file to use the master database instead? The php for the scroller is below:

You probably have to modify the module to hardcode the DB conenction and always request the master DB.

I suppose that the access are performed in the "getProducts" routine
$list = modRokVirtuemartScrollerHelper::getProducts($params);

We also propose billable support that can be used for specific development or installation, teachnig, ...
So if you want that we create a specific modified module that perform such "hardcoded" master access, you can order such billable support at
http://www.jms2win.com/download?page=shop.product_details&flypage=flypage.tpl&product_id=35&category_id=1

==========

How many hours of billable support do you think I will need to buy?

Thanks again Edwin!!!

Sondra
