

## Patches fail - □ Add 16 lines containing the routin

Posted by gdowling - 2010/02/21 12:36

---

Sorry to ask such a basic question, but I am very much a newbie here:

I have installed com\_multisites\_V1.2.22 and all is working well, until I decided to install the com\_multisites\_V1.2.22 onto another domain (sub domain iin this case).

I am guessing I am getting the error as it was already installed on a different domain.

Anyway it fails to install all the required patches (see below)

administrator/components/com\_multisites/install.xml OK

administrator/index.php OK

administrator/includes/defines.php OK

includes/defines.php OK

includes/defines\_multisites.php OK

includes/multisites.php OK

installation OK

installation/includes/defines.php OK

installation/installer/helper.php OK

installation/installer/jajax.php OK

xmlrpc/includes/defines.php OK

configuration.php Not OK

•The routing wrapper is not present in this MASTER configuration file.

Actions:

□ Add 16 lines containing the routing wrapper to the slave site.

administrator/components/com\_config/controllers/application.php OK

administrator/components/com\_installer/models/templates.php OK

administrator/components/com\_modules/models/module.php OK

administrator/components/com\_templates/admin.templates.html.php OK

administrator/components/com\_templates/controller.php OK

libraries/joomla/application/application.php OK

libraries/joomla/document/html/html.php OK

libraries/joomla/filesystem/folder.php OK

libraries/joomla/session/session.php OK

components/com\_content/helpers/route.php OK

plugins/system/remember.php OK

I have tried the uninstall & reinstall route, but the same accurs, please can someone advise...

Thanks

Gary

If you are trying the call JMS from a slave site, this is a kind of message that you can have as the slave site configuration file does not contain any wrapper.

JMS should not be installed and used in a slave site.  
Theorically, only the master website needs to have the JMS installed.

If you have this error from the master website, then you can also go in the Global Configuration and re-save it. This also write the wrapper (only when you are the master).

JMS working now for all my slave sites, now how can I get templates (layout) working - see my other post..

Thanks for your help..

Gary
