

## Unable to get the Website ID

Posted by muskes - 2010/04/12 17:48

---

Hello,

when I add a php-script in the field "On deploy success" I receive the errormessage:

Unable to get the Website ID

Whats going wrong?

Thank You.

Regards

muskes

---

I receive this message:

An error occurs when creating the site ID = for the user

The error reported is : 004

The message is: ArrayError code starting with the letter is a warning and the website is created for a limited period of time with ads displayed.

If this is the case, you probably must increase your website quota in the www.jms2win.com website.

...but I don't use billable websites, I just want to add/execute a script, which creates automatically the subdomains and maps them to the deployed directory.

Regards

Muskes

To customize (use the scripts), you need to have registered JMS and enable the "billable website" that works with website quota.
